On behalf of myself, I respectfully request the NCCN Lymphoma & Leukemia Guideline panels to review the enclosed data for consideration of Vitamin D-25OH and bone mineral density testing in these patient populations.

**Specific Changes:** Recommend the serum free light chain assays as a routine component of the initial diagnostic evaluation of multiple myeloma (changed from "useful under some circumstances").

Add language in workup for NHL, HL, and CLL:

**Consider Vitamin D-25OH and bone mineral density testing.**

**Rationale:**

The following articles are submitted in support of this proposed change.

**Bone Mineral Density Testing**
(see also manuscript references for deeper background):
