Dear NCCN Guidelines Panel,

On behalf of Genentech, Inc., I respectfully request the Colon and Rectal Cancer Guideline Panel to review the enclosed data for:

- **Tecentriq® (atezolizumab)**
  

**Specific Changes:**

There are no specific changes being requested. We are providing data on Tecentriq® with or without Cotellic® in patients with chemotherapy-refractory metastatic colorectal cancer.

**FDA Clearance:**

- Tecentriq is not FDA-approved for treatment of patients with chemotherapy-refractory metastatic colorectal cancer.
- Cotellic is not FDA-approved for treatment of patients with chemotherapy-refractory metastatic colorectal cancer.

Please refer to the product prescribing information for full FDA-approved indications and safety information.

**Rationale:**

IMblaze370 is a Phase 3, multicenter, open-label, three-arm, randomized study conducted to evaluate the efficacy and safety of Tecentriq with or without Cotellic vs. regorafenib in patients with locally advanced or metastatic colorectal cancer who have received at least two prior regimens of chemotherapy for metastatic disease. The primary endpoint of overall survival (OS) was not met.
Safety in the Tecentriq + Cotelic arm was consistent with the known safety profiles of the individual agents. Grade 3-4 treatment-related adverse events (AEs) occurred in 45%, 10%, and 49% of patients receiving Tecentriq with Cotelic, Tecentriq monotherapy, and regorafenib, respectively. Treatment-related serious AEs occurred in 26%, 8%, and 11% of patients receiving Tecentriq with Cotelic, Tecentriq monotherapy, and regorafenib, respectively.

IMblaze370 is the first study to present results for Tecentriq with or without Cotelic for patients with chemotherapy-refractory metastatic colorectal cancer.

Additional studies have been done to evaluate Tecentriq with Cotelic in metastatic colorectal cancer.¹
