On behalf of Genentech, I respectfully request the NCCN Ovarian Cancer Guideline Panel to review the enclosed data for the use of Avastin® (Bevacizumab) in the treatment of patients with previously untreated, advanced epithelial ovarian, primary peritoneal or fallopian tube cancer.

Specific Changes: Consider two recent publications of two pivotal, Phase III studies involving the study of Avastin in patients with previously untreated, advanced epithelial ovarian, primary peritoneal or fallopian tube cancer for your updating purposes. Both of these studies were previously presented at medical congresses, and the results are now available in full journal publications.

FDA Clearance: FDA has not been approved Avastin for the treatment of ovarian cancer. Please refer to the enclosed prescribing information for the full FDA-approved indications and safety information.

Rationale: Two pivotal studies, GOG-218 and ICON-7, were recently published in the New England Journal of Medicine. GOG-218 is a Phase III, international, multicenter, placebo-controlled, randomized, double-blind study and ICON7 is a Phase III, multicenter open-label Gynaecologic Cancer InterGroup (GCIG) trial.1,2 Both trials studied different regimens of Avastin in combination with carboplatin and paclitaxel compared to carboplatin and paclitaxel alone and included a maintenance regimen with Avastin.
