NCCN Guidelines Panel: Breast Cancer

On behalf of Genomic Health, Inc., I respectfully request the NCCN Breast Cancer Panel to review the enclosed data for inclusion of the Oncotype DX® Breast Recurrence Score™ (RS) assay, also known as the 21-gene RT-PCR assay, in the initial work-up for patients diagnosed with early stage ER+, HER2-negative, lymph node-positive (1-3 nodes) breast cancer, to stratify patients by risk of recurrence and identify patients with likely chemotherapy benefit.

Specific Changes: Elevate the 21-gene RT-PCR assay from “footnote ee” on page BINV-6 to the clinical algorithm as a component of the initial work-up for patients after diagnosis with early stage ER+, HER2-invasive breast cancer with 1-3 positive lymph nodes, in a manner consistent with use of the 21-gene RT-PCR assay for node-negative patients (BINV-6).

FDA Clearance: FDA clearance is not required for this assay because it is performed in the central laboratory at Genomic Health, which is regulated and certified under the Clinical Laboratory Improvement Amendments (CLIA) and the College of American Pathologists (CAP).

Rationale: In support of these changes, the 21-gene RT-PCR assay was validated in node-positive patients in two prospectively designed studies to predict risk of distant recurrence and identify patients who are likely to benefit from chemotherapy. More recently, prospective outcomes in >7K node-positive patients (1-3 positive nodes) have been reported in three cohorts, including the WSG PlanB study showing 3- and 5-year disease free survival data, the SEER registry showing 5-year breast cancer specific mortality data, and the Israeli Clalit registry showing 5-year distant recurrence data. All of these studies show that patients with low RS results have highly favorable outcomes when treated with endocrine therapy alone, providing strong and consistent support that the 21-gene RT-PCR assay provides important prognostic information in node-positive disease.

The following articles are submitted in support of this proposed change.
